Migrate User Administrative Tool Documentation

Project Overview

The Audience

This project is intended for platform administrators, desktop support technicians, and macOS administrators who support reimaged Macs and need to restore access to migrated user home folders.

The Goal

The goal of this project was to present a real administrative scripting workflow as a technical writing sample. I originally created this tool to support a macOS migration task in an enterprise environment. For this portfolio version, I revised the documentation, comments, prompts, and warnings to make the tool clearer, more maintainable, and more appropriate for an administrator audience.

Constraints and Challenges

Challenge 1: Reworking an internal tool for a portfolio

The original script was created for internal use, not public presentation, so I revised the documentation and messaging for an outside audience while preserving the original workflow.

Challenge 2: Writing for administrators

The documentation needed to address a technical audience familiar with macOS administration, permissions, and Active Directory, while still providing clear instructions and warnings.

Challenge 3: Explaining assumptions and risks

The script depends on correct folder placement, accurate account naming, and Active Directory binding, so those prerequisites had to be made explicit.

Challenge 4: Improving in-tool text

I revised the original prompts and comments to improve clarity, consistency, and usability.

Tools

AppleScript, Markdown, GitHub, Microsoft Word, technical editing, and revision for administrator-facing documentation

Results

The final sample includes a polished administrator README, a revised AppleScript with improved comments and dialog text, a historical note, and a project description. This project demonstrates my ability to document internal administrative tools, revise user-facing technical text, and present a technical workflow in a structured, audience-focused format.
